

BID POWER TENDERS WITH **THE ANSWER**, NOT A GUESS.

Joulewise reads the tender, sizes the plant, prices the bid over its full term and shows you the margin. It covers round-the-clock, FDRE, peak, battery storage and hybrid power sales, from the first read of the RfS to the bid you submit.

THE VALUE

WEEKS OF BID WORK, DONE IN HOURS

A bid team typically spends 80–140 analyst hours on each tender before a number reaches the bid committee. Joulewise brings that to about four hours of review, so the team spends its time on judgement rather than spreadsheets.

PER TENDER	TYPICAL MANUAL EFFORT	WITH JOULEWISE
Read the RfS and amendments, extract requirements	16–24 h	~1 h review
Build the sizing model and resource profiles	24–40 h	minutes
Run 10–20 sizing cases	20–40 h	minutes each
Financial model and tariff for the target IRR	12–24 h	in every run
Compliance checklist, risk register, bid pack	8–16 h	1–2 h
Total	80–140 h	~4 h

YOUR TEAM

Tenders bid per year

12

1,296

analyst hours saved a year

32

person-weeks back for the team

Indicative: 108 hours saved per tender, the mid-point of the table. Your numbers depend on tender complexity and how your team works today.

FULL TRACEABILITY

EVERY NUMBER CAN BE TRACED TO WHERE IT CAME FROM

Bid committees, lenders and auditors can follow any figure back to its source without asking an analyst.

↳ Tender → value

Every requirement shows its page, clause and the tender text it was read from.

↳ Overrides

Edited and locked values are marked, so you always know what came from the tender and what from your team.

↳ Optimizer runs

The solver log records what was searched, every improvement, the HiGHS output and the final checks. You can download it.

↳ Financial model

Year-by-year revenue, costs, debt, tax and DSCR, exported to Excel or CSV. Nothing is hidden in a macro.

↳ Versions

Every save is a version with its inputs and results. Compare, restore or export any of them.

↳ People

Sign-ins, runs, saves and exports are recorded per user, with an audit export.

HOW IT WORKS

FROM RFS TO BID IN ONE FLOW

One story for every tender, with each step feeding the next and every number traceable to the clause it came from.

01 · READ

Read the tender

Upload the RfS and its amendments. Layout-aware parsing with table recognition and OCR pulls out the requirements, deadlines, securities, penalties and risks.

02 · CONFIRM

Confirm the requirements

Every value shows its confidence, page and clause. Edit or lock anything; locked values survive a corrigendum.

03 · OPTIMIZE

Size and price

Solar, wind and battery sizes, oversizing and augmentation are optimized against the full-term tariff, with degradation, debt, tax and penalties included.

04 · BID

Bid and advise

The tariff or capacity charge at your target IRR, the margin to the ceiling, a compliance checklist, the financial model and saved, versioned scenarios for the bid committee.

THE PRODUCT

ONE WORKSPACE FOR EVERY POWER SALES BID

Purpose-built modules that share one engine, one data model and one audit trail.

ROUND THE CLOCK

Firm supply sizing

Least-tariff solar + wind + BESS for any demand profile and DFR target, with the HiGHS global optimum and an exact 25-year check.

BESS TENDER

Standalone storage bids

Capacity charge in ₹/MW/month, oversizing and augmentation plan, RTE and availability compliance, VGF and ceiling margin.

FDRE

Peak and firm dispatchable RE

Peak-hour availability, annual CUF bands, penalties at 1.5× tariff, and the full RfS rule set modelled hour by hour.

TENDER INTELLIGENCE

Parsing and risk

Requirements, eligibility, securities, timelines, amendments and risk flags, each linked back to the source clause.

YIELD

EYA report

Wind and solar energy yield with loss waterfalls, P50/P75/P90 and a printable report, fed straight into the optimizer.

FINANCE

Bankable financial model

P&L, cash flow, debt, DSCR, WDV tax, working capital and augmentation capex, with the tariff solved for the equity IRR. Export to Excel or CSV.

THE CHEAPEST PLANT THAT MEETS THE DFR EVERY YEAR

A HiGHS linear programme finds the global optimum of the 25-year tariff, and the exact financial model then prices its neighbours. You see the answer and the proof.

- A proven floor: no design in range can beat the stated tariff
- Tariff map across every solar × wind size
- What ageing costs: degradation and augmentation, in ₹/kWh
- Shadow price of DFR: what each extra point would add to the tariff

MIN DSCR · PAYBACK

1.11

× · yr 9

HiGHS solved the sizing LP (70,083 variables, 1,05,122 constraints, years 1, 25) in 45.1 s: no design in the allowed ranges can have a 25-year tariff below ₹5.6522/kWh under the LP's linear tax model. The answer above is the exact financial model's best design next to that optimum. Each extra percentage point of DFR would add ≈ ₹0.099/kWh.

FROM THE RFS TO THE CAPACITY CHARGE

Upload a storage tender and confirm what it asks for. Joulewise then prices every oversizing and augmentation strategy over the contract term and returns the lowest compliant capacity charge.

- Requirements with confidence, page and clause
- Energy at the delivery point kept every year, block by block
- Bid against the ceiling, with VGF and penalties priced in
- Every strategy on one map; click to load any of them

EVERY NUMBER TRACEABLE TO ITS CLAUSE

Layout-aware parsing (Docling) reads tables and scanned pages; clause-aware retrieval finds the requirements and risks. Nothing is a black box: open any value and read the tender text behind it.

- Penalties, securities, bid limits and timelines
- Risk flags with severity and bid implication
- Amendments tracked against the base tender

SEE EVERY HOUR, AND EVERY DECISION

Day, month and year dispatch, including surplus charging the battery, curtailment and its reasons. The optimizer log records what was searched and why the answer won.

- Hour-by-hour flows and state of charge
- Solver log with HiGHS output, downloadable
- Saved scenarios with version history and comparison

Hour by hour. Solid bands serve the customer (solar, wind, battery discharge); hatched bands above demand are surplus: charging the battery, sold, or curtailed. Step through the year with < >, switch to 7 days, lock the y-axis or export a PNG.

EVERY KIND OF POWER SALES TENDER

BUILT FOR THE INDIAN POWER MARKET

One platform for bid preparation and bid advisory across tender families, from central agencies to state discoms and C&I buyers.

RTC Round-the-clock RE supply with DFR

FDRE Firm and dispatchable RE, peak supply

BESS Standalone storage, VGF, capacity charge

HYBRID Solar-wind hybrid with or without storage

PEAK Peak power and assured peak supply

SOLAR / WIND Plain-vanilla RE auctions

C&I Open-access and captive PPAs

e-RA Reverse-auction tariff strategy

Developers & IPPs

Bid the lowest compliant tariff with confidence in the margin, the risks and the lender case.

Bid advisory firms

Run many tenders for many clients with traceable, repeatable analysis and versioned deliverables.

Utilities & procurers

Benchmark expected tariffs and test tender design before issuing the RfS.

Lenders & investors

Check sizing, degradation, augmentation and DSCR behind a bid or an acquisition.

YOUR BID STRATEGY STAYS YOURS

What you plan to bid is the most sensitive number in the company. Each organisation gets its own isolated environment, so no other customer, and no one outside your organisation, can see what you are working on.

CLOUD

DEDICATED CLOUD

A workspace of your own, with its own database, in an Indian data centre. Nothing to install, and updates are applied for you.

- ✓ Premium and Ultra
- ✓ Separate database and application per organisation
- ✓ Daily encrypted backups

ON-PREMISE

INSIDE YOUR NETWORK

The full platform runs as containers on your own servers. Tender documents and bid economics never leave your premises.

- ✓ Ultra
- ✓ No outbound data: parsing and optimization run locally
- ✓ Your backup, retention and access policies

ENCRYPTION

AES-256 AT REST. TLS 1.3 IN TRANSIT.

Data is encrypted to the same standards banks and governments rely on: AES-256 for stored data, databases and backups, and TLS 1.3 for every connection between your browser and the platform.

ISO/IEC 27001

Certification in progress for our information security management system.

■ Isolated by design

One database per organisation. No shared tables and no cross-customer queries.

■ No one else sees your thinking

Your tenders, scenarios and bids are visible only to the people your administrator allows.

■ Never used to train models

Your documents and results are not shared with third parties or used for training.

■ Strong credentials

Passwords are stored as memory-hard scrypt hashes. Sessions are signed and can be revoked by an administrator.

■ Least-privilege access

Administrators decide who sees which module, down to the individual user.

■ Audit trail

Every sign-in, failed sign-in, run, save and export is recorded and exportable.

MANY TEAMS, MANY TENDERS, ONE PLATFORM

For developers and advisory firms where several teams bid in parallel: shared libraries and profiles, team-level access, organisation-wide activity and custom tender families, on-premise or in a dedicated cloud.
